Aerobatic Stress Note V30047 F38, F63

This model was not designed for the stress of aerobatics. If loops, rolls, etc., are to be included in flying, then the wing should be strengthened. This can be accomplished by adding 3/16 x 1/2 hardwood spars across center section, extending 3 or 4 rib spaces on each side. Notch out ribs to receive spars and use cement generously on entire installation.
