Notes - For electric or rubber use "crutch" method & split formers vertically — use 1/16 stringers spaced approx 3/4" instead of planking — add ribs to vertical fin & replace blocks with sheet structure — use 1/8 dowels to hold wing — wing halves are joined using plywood gussets. Inverted gull lower wing shortened to 48" mit monopod gear & use conventional two wheel gear - OS electric R/C spars to be per "old nog" glider design.
